IN THE CLAIMS

Claims 1-21 (canceled)

22. (currently amended) A strip coating installation ~~having with~~ a vacuum chamber which has, between a rear wall and at least one removable closing plate, a casing with a flat top, wherein at least one guide ~~roller, roller and~~ a coating roller with an axis (A), and at least one coating ~~source source~~, are positioned inside the vacuum ~~chamber; wherein chamber, wherein~~ the ends of the at least one guide roller and of the coating roller that face ~~toward towards~~ the ~~removable~~ closing plate are attached by supporting elements and ~~with~~ bearings to the top, and wherein ~~a space the space~~ in the vacuum chamber beneath the coating roller is ~~kept~~ free of the supporting elements.

23. (currently amended) A strip coating installation as in claim 22, wherein the at least one guide roller and the coating roller are ~~mounted at the mounted, at their~~ ends that face away from the closing ~~plate on plate, on~~ bearings on the rear wall.

24. (currently amended) A strip coating installation as in claim 22, wherein the at least one guide roller and the coating roller are, at ~~the their~~ ends that face away from the closing plate, mounted on bearings on ~~the~~ supporting elements in front of the rear wall and held on the top.

25. (currently amended) A strip coating installation as in claim 22, wherein the space beneath ~~the coating roller~~ and at the side of the coating roller is divided by ~~means of~~ partitions into at least two chamber sections, and wherein the partitions have sealing elements at ~~their~~ ends that face towards the coating roller, ~~wherein~~ the curvature of ~~the sealing which~~ elements is ~~configured made~~ to fit the radius of the coating roller in such a manner that curved sealing gaps are formed between the sealing elements and the coating roller.

26. (currently amended) A strip coating installation as in claim 25, wherein each of the sealing elements is connected to an ~~its~~ accompanying partition by an adjustment mechanism ~~in such a manner~~ that the sealing gaps can be adjusted to a smallest ~~the smallest~~ possible size in a radial direction.

27. (currently amended) A strip coating installation as in claim 22, wherein, inside the vacuum chamber at least four chamber sections are formed on a ~~on the~~ circumference of the coating roller with ~~by means of~~ partitions.

28. (currently amended) A strip coating installation as in claim 22, wherein the two uppermost partitions enclose an angle of between 120 and 180 degrees downwards in relation to the axis (A).

29. (currently amended) A strip coating installation as in claim 22, wherein a ~~the~~ circumferential section of the casing that is beneath the two uppermost partitions is ~~made~~ in the shape of a part-cylinder.

30. (currently amended) A strip coating installation as in claim 29, wherein ~~in the chamber section that is above the two uppermost partitions, there are positioned~~ a total of four ~~our~~ guide rollers are positioned in a chamber above two uppermost partitions.

31. (currently amended) A strip coating installation as in claim 22, wherein ~~the~~ partitions have, at ~~their~~ ends that face away from the rear wall, radial sealing strips against which the closing plate can be brought to rest.

32. (currently amended) A strip coating installation as in claim 31, wherein the sealing strips have elastomeric sealing edges that run parallel to ~~their~~ radial center ~~centre~~ lines thereof, against which edges the closing plate can be brought to rest when vacuum chamber is closed.

33. (currently amended) A strip coating installation as in claim 32, wherein the coating roller has an end face that faces towards the closing plate, in front of which end face is positioned a fixed ring sector which encloses the lower end of the supporting element for the coating roller around part of a of the circumference thereof.

34. (currently amended) A strip coating installation as in claim 22, wherein the coating roller is surrounded at its ends thereof, inside the chamber sections), by strip-shaped screens that are curved cylindrically and coaxially, which screens enclose the said ends with narrow gaps and shield the coating roller from being coated on its surfaces thereof that are not covered by the strip.

35. (previously presented) A strip coating installation as in claim 34, wherein a screen is a the front screen having has an elastomeric sealing edge against which the closing plate can be brought to rest when the vacuum chamber is closed.

36. (currently amended) A strip coating installation as in claim 34, having a wherein the ring sector extends over the circumference as far as its end edges inside the front screen.

37. (currently amended) A strip coating installation as in claim 22, wherein an the overall height of the installation, measured from the surface on which it is mounted, is a maximum of 2.5 meters.

38. (currently amended) A strip coating installation as in claim 22, wherein the vacuum chamber has, on each of the two sides of the coating roller, a side chamber, wherein in ~~chamber, in each of the side chambers which~~ are positioned a winding spindle for an off-winding roller and a take-up roller respectively, and accompanying guide rollers for a for the strip.

39. (previously presented) A strip coating installation as in claim 32, wherein the side chambers are in the form of vacuum chambers and are linked to the chamber section of the vacuum chamber by means of slot-shaped gaps for the strip to pass through.

40. (currently amended) A strip coating installation as in claim 22, wherein the installation has chamber sections and side chambers, wherein each of the chamber sections of the vacuum chamber and ~~the~~ side chambers is connected to a vacuum pump of its own.

41. (currently amended) A strip coating installation as in claim 38, wherein ~~the~~ top surfaces of the side chambers are at least substantially positioned at a ~~at the~~ same height as a ~~as~~ ~~the~~ top of the vacuum chamber.
